Lizhen Q

Recap

Overview of the NLP Lectures

- Introduction to natural language processing (NLP).
- Regular expressions, sentence splitting, tokenization, part-of-speech tagging.
- Language models <https://eduassistpro.github.io/>
- Vector semantics.
- Parsing.
- Compositional semantics.

Assignment Project Exam Help

Add WeChat edu_assist_pro

Language Models

- Goal: assign a probability to a word sequence.
 - Speech recognition:
 - $P(\text{I ate a cherry}) > P(\text{Eye eight Jerry})$
 - Spelling correction:
 - $P(\text{Australian National University}) > P(\text{Australian National Univerisity})$
 - Collocation e
 - $P(\text{high wind})$
 - Machine Translation:
 - $P(\text{The magic of Usain Bolt on s at the show ...})$ \rightarrow $P(\text{e magic of Usain Bolt})$
 - Question-answering, summarization, etc.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Probabilistic Language Modeling

- A language model computes the probability of a sequence of words.
 - A vocabulary \mathcal{V} .
 - $p(x_1, x_2, \dots, x_l) \geq 0$
 - $\sum_{(x_1, x_2, \dots, x_l) \in \mathcal{V}^*} p(x_1, x_2, \dots, x_l) = 1$
- Related task: probability of x_4 given word x_1, x_2, x_3 .
 - $p(x_4 | x_1, x_2, x_3)$
- LM: Either $p(x_4 | x_1, x_2, x_3)$ or $p(x_1, x_2, \dots, x_l)$.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

How to Compute $p(x_1, x_2, \dots, x_l)$

- Apply chain rule:

$$P(x_1, x_2, \dots, x_l) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2)\dots P(x_l|x_1, \dots, x_{l-1})$$

Assignment Project Exam Help

- Compute

<https://eduassistpro.github.io/>

$P(\text{All Blacks' hotel room bugged}) = P(\text{All}) P(\text{Bl} \mid \text{All}) P(\text{'} \mid \text{All Blacks})$
... $P(\text{bugged} \mid \text{All Blacks's hotel room})$

Add WeChat edu_assist_pro

Estimate the Probabilities

- $P(\text{bugged} \mid \text{All Blacks's hotel room}) =$

$$\frac{\text{Count}(\text{All Blacks's hotel room bugged})}{\text{Count}(\text{All Blacks's hotel room})}$$

Assignment Project Exam Help

- Not enough data <https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Markov Assumption

- Simplification:

- $P(\text{bugged} \mid \text{All Blacks's hotel room}) = P(\text{bugged} \mid \text{room})$
- or $P(\text{bugged} \mid \text{All Blacks's hotel room}) = P(\text{bugged} \mid \text{hotel room})$

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- First-order M

Add WeChat edu_assist_pro

$$\begin{aligned} P(x_1, x_2, \dots, x_l) &= P(x_1) \prod_{i=2}^l P(x_i \mid x_1, \dots, x_{i-1}) \\ &= P(x_1) \prod_{i=2}^l P(x_i \mid x_{i-1}) \end{aligned}$$

Unigram Model

- Zero-order Markov assumption.

$$P(x_1, x_2, \dots, x_l) = \prod_i^l P(x_i)$$

- Examples generated from a unigram model.

<https://eduassistpro.github.io/>

*Months the my and issue of year exchange's
september were recession excha orsed a acquire
to six executives*

Bigram Model

- First-order assumption.

$$P(x_1, x_2, \dots, x_l) = P(x_1) \prod_{i=2}^l P(x_i | x_{i-1})$$

- $P(\text{I want to eat Chinese food}) = ?$

- Estimate bigr <https://eduassistpro.github.io/> training corpus.

Add WeChat edu_assist_pro

Trigram Models

- Second order assumption.

$$P(x_1, x_2, \dots, x_l) = P(x_1)P(x_2|x_1) \prod_{i=3}^l P(x_i|x_{i-1}, x_{i-2})$$

- long-distance Assignment Project Exam Help.

<https://eduassistpro.github.io/>
“The iphone which I bought ago does
not stand the cold.” Add WeChat edu_assist_pro

- We can extend to 4-grams , 5-grams ...

Restaurant Corpus

Bigrams :

	I	want	to	eat	Chinese	food	lunch
I	8	1087	0	13	0	0	0
want	3	0	786	0	6	8	6
to	3	0	10	860	3	0	12
eat	0	0				2	52
Chinese	2	0	0	0		120	0
food	19	0	17	0	0	0	0
lunch	4	0	0	0	0	1	0

Unigrams :

I	want	to	eat	Chinese	food	lunch
3437	809	1265	3256	938	213	459

Total : 11024

Compute Bigram Probabilities

- Maximum likelihood estimation:

$$P(x_i|x_{i-1}) = \frac{\text{count}(x_{i-1}, x_i)}{\text{count}(x_{i-1})}$$

- Bigram probabilities:

– $P(\text{want}|\text{I}) =$

<https://eduassistpro.github.io/>

- Log probabilities:

– $\log P(\text{I want to eat Chinese food}) = \log P(\text{I}) + \log P(\text{want} | \text{I}) + \log P(\text{to}|\text{want}) + \log P(\text{eat}|\text{to}) + \log P(\text{Chinese}|\text{eat}) + \log P(\text{food}|\text{Chinese})$

Sequence Generation

- Compute conditional probabilities.

- $P(\text{want} \mid I) = 0.32$

- $P(\text{to} \mid I) = 0$

- $P(\text{eat} \mid I) = 0.004$

- $P(\text{Chinese} \mid I) = 0$

- $P(I \mid I) = 0.0$

- ...

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- Generate a random number in $[0, 1]$.

- See which region it falls into.

Approximating Shakespeare

- Generate sentences from a unigram model.
 - Every enter now severally so, let
 - Hill he late speaks; or! a more to leg less first you enter
- from a bigram model
 - What means captain. all sorts, he is trim,
 - Why dost stand forth thy can h; he is this palpable hit the King Henry.
- from a trigram model.
 - Sweet prince, Falstaff shall die.
 - This shall forbid it should be branded, if renown made it empty.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

The Perils of Overfitting

- $P(\text{I want to eat Chinese lunch.}) = ?$ when $\text{count}(\text{Chinese lunch}) = 0$.
- In real life, the test corpus is often different than the training corpus
<https://eduassistpro.github.io/>
- Unknown words! Add WeChat edu_assist_pro

Generalization by avoiding zeros!

Interpolation

- Key idea: mix of lower-order n-gram probabilities.
- For bigram model:

$$\hat{P}(x_i | x_{i-1}) = \lambda_1 P(x_i | x_{i-1}, x_{i-2}) + \lambda_2 P(x_i | x_{i-1}) + \lambda_3 P(x_i)$$

$$\lambda_1 \geq 0, \lambda_2 \geq 0, \lambda_3 \geq 0$$

Add WeChat edu_assist_pro

- For trigram model:

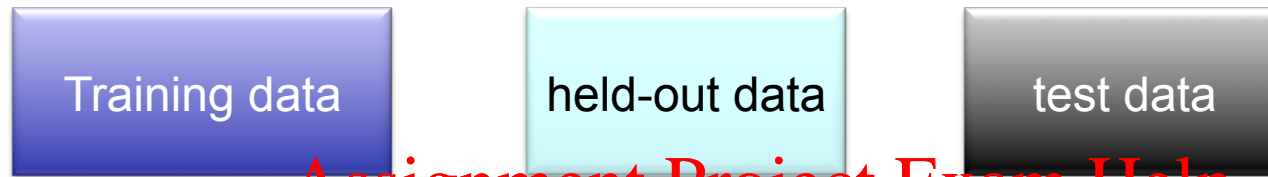

$$\hat{P}(x_i | x_{i-1}, x_{i-2}) = \lambda_1 P(x_i | x_{i-1}, x_{i-2}) + \lambda_2 P(x_i | x_{i-1}) + \lambda_3 P(x_i)$$

$$\lambda_1 \geq 0, \lambda_2 \geq 0, \lambda_3 \geq 0$$

$$\sum_i \lambda_i = 1$$

How to Set the Lambdas?

- Estimate λ_i on the held-out data.

Assignment Project Exam Help

- One simple example is <https://eduassistpro.github.io/>.

Add WeChat edu_assist_pro

$$\lambda_1 = \frac{\text{count}(x_{i-1}, x_{i-2})}{\text{count}(x_{i-1}, x_{i-2}) + \gamma}$$

$$\lambda_2 = (1 - \lambda_1) \times \frac{\text{count}(x_{i-1})}{\text{count}(x_{i-1}) + \gamma}$$

$$\lambda_3 = 1 - \lambda_1 - \lambda_2$$

Absolute Discounting Interpolation

- Absolute discounting.

$$P_{\text{AbsDiscount}}(x_i|x_{i-1}) = \frac{\text{count}(x_i, x_{i-1}) - d}{\text{count}(x_{i-1})} + \lambda(x_{i-1})P(x_{i-1})$$

Assignment Project Exam Help

- Often use $d =$ <https://eduassistpro.github.io/>
Add WeChat edu_assist_pro
- Is it sufficient to use $P(x_{i-1})$?

Kneser-Ney Smoothing (i)

- Better estimate for probabilities of lower-order unigrams!
 - Shannon game: *I can't see without my reading*_____?
 - “Francisco” is more common than “glasses”
 - ... but “Francisco” always follows “San”

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- $P_{\text{continuation}}(x)$: How likely is a word to appear as a novel continuation?
 - For each word x , count the number of bigram types it completes.

$$P_{\text{continuation}}(x_i) \propto |\{x_{i-1} | \text{count}(x_{i-1}, x_i) > 0\}|$$

Knersey-Ney Smoothing (ii)

- Example:

$$|\{x_{i-1} | \text{count}(x_{i-1}, \text{Francisco}) > 0\}| \ll$$

$$|\{x_{i-1} | \text{count}(x_{i-1}, \text{glasses}) > 0\}|$$

Assignment Project Exam Help

- Normalized bigram types.

<https://eduassistpro.github.io/>

$$|\{(x_{j-1}, x_j) | \text{count}(x_{j-1}, x_j) > 0\}|$$

Add WeChat edu_assist_pro

$$P_{\text{continuation}}(x_i) = \frac{|\{x_{i-1} | \text{count}(x_{i-1}, x_i) > 0\}|}{|\{(x_{j-1}, x_j) | \text{count}(x_{j-1}, x_j) > 0\}|}$$

Kneser-Ney Smoothing (iv)

- definition for Bigrams:

$$P_{\text{KN}}(x_i|x_{i-1}) = \frac{\max(\text{count}(x_{i-1}, x_i) - d, 0)}{\text{count}(x_{i-1})} + \lambda(x_{i-1})P_{\text{continuation}}(x_i)$$

Assignment Project Exam Help

where

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

$$\lambda(x_{i-1}) = \frac{d}{\text{count}(x_{i-1})} |\{x | \text{count}(x_{i-1}, x) > 0\}|$$

<https://nlp.stanford.edu/~wcmac/papers/20050421-smoothing-tutorial.pdf>

Evaluation of Language Models

■ Extrinsic evaluation:

- Put each model in a task
 - Spelling correction, machine translation etc.
- Time consuming.
- Task dependent.

Assignment Project Exam Help

■ Intrinsic evaluation

- perplexity.
- Useful in pilot experiments.

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

$$= P(x_1 x_2 \dots x_L)^{-\frac{1}{L}}$$

$$= \sqrt[L]{\frac{1}{P(x_1 x_2 \dots x_L)}}$$

$$= \sqrt[L]{\prod P(x_i | x_{i-1})}$$

	Unigrams	Bigram	Trigram
